

Interactive Digital Art and Design SE608

Project Proposal Year IV

Student Name:	Aoife Leahy	Student Number:	C00296873
Working Title:	Interactive 2D Animated Story		
Description:	I want to create an interactive 2D story that works through a website. It would be like an illustrated novel, where the user reads the story and is given different choices throughout it. The choices the user makes will affect what happens in the story and can lead to different story paths and endings. The main character will be created and rigged in 2D so that they can be animated within the different scenes. The animations will be connected to the choices made by the user. For example, the character could be in a room, and the user could be given the choice to go to the door or the window. If the user chooses the door, the character would be animated walking over to the door and opening it. What happens next would depend on the story. The character could walk through the door, which could lead to the next scene, or the door could close and something else could happen instead. If the user chooses the window, a different animation and event would happen. The animation would play after the user makes their choice and would then stop when that part of the story is finished. The next part of the story or the next choice could then appear. A fade in or fade out could also be used when changing between different scenes to make the story flow more smoothly. I will create the character designs, backgrounds and other artwork for the story. I will also create and animate the 2D character rig. The website will be programmed so that the user's choices can trigger different animations and story events. The story will have different paths depending on the choices made. I plan to have a restart option so that the user can start the story again and make different choices. This would allow the user to see the other possible paths and endings without having to go backwards through the story.		
Reasons for selecting project:	I chose this project because I prefer the artistic side of my course. I am most interested in things like animation, character design, illustration and storytelling, and I would like to have a future career that is more focused on the artistic side. I also want to learn more about 2D rigging and animation. We have only briefly looked at rigging before, and I have never used it for a large

	project. This project would give me the chance to learn more about it and use it as a main part of my project. I am not a very strong coder, and I find coding more difficult than the artistic parts of the course. However, I still want to include coding in my project and improve my skills. The coding will be needed to make the choices work, connect them to the animations and decide which part of the story happens next. The main focus of the project will be the artwork, animation and story, while coding will be used to make the project interactive. I also think it would be a good project for my portfolio because it would show my character design, illustration, animation and storytelling skills, while also showing that I can use coding to make an interactive project.
Proposed research content:	I looked at a few different articles and websites to get ideas for my project and to understand how some of the parts of my idea could work. I looked at an Adobe article about 2D rigging. It explained how a character can be made from different parts and have a skeleton added so that the parts can be moved and animated. This gave me a better understanding of how 2D rigging works and helped me decide that I could use a rigged character as one of the main parts of my project. I also looked at a FutureLearn article about interactive experiences and branching stories. It explained how a story can change depending on the choices made by the user. It also showed how different choices can lead to different parts of a story. This helped me come up with the idea of having the user make choices that control what the character does and where the story goes. I looked at an SAE article about narrative design and storytelling in interactive environments. This gave me more ideas about how the story and the user's choices could work together. It helped me decide that I wanted the choices to actually affect what happens in the story, rather than just changing some of the text.

Hardware requirements:	1. College PC with access to both Windows and Linux. 2. My own drawing tablet for creating the artwork and characters.
Software requirements:	• SvelteKit for creating the website • HTML, CSS and JavaScript for the interactive parts • Clip Studio Paint, which I already have a subscription for, for creating characters, backgrounds and other artwork • Adobe Photoshop and/or Illustrator for artwork if needed • Adobe After Effects for animation if needed • A suitable 2D animation and rigging program, depending on what works best for the project • Figma for planning the website and interface
Other requirements:
